3. Acknowledgement of new claims 41 and 42 has been noted. The new claims have been entered and reviewed. No new matter has been introduced.
4. Acknowledgement to the amendment of claims 1, 19-20, 35-40 has been noted. The amendment has been entered and reviewed. No new matter has been introduced.

**EXAMINER'S AMENDMENT**

5. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with David Shifren (Reg. No. 59,329) on March 17, 2011.

6. **Please amend claims 6, and 32, 34 as follows:**

Claim 6. (Currently Amended) The method of claim 1 wherein the key utilized by the seed generation client to encrypt the second string comprises [[a]]the secret key shared by the seed generation client and the seed generation server.

Claim 32. (Currently Amended) The method of claim 31 wherein the signal from the authentication entity comprises ~~[[an]] the authentication code cryptographically derived from the seed.~~

Claim 34. (Currently Amended) The method of claim 33 wherein the signal from the authentication token comprises ~~[[an]] the authentication code cryptographically derived from the seed.~~

7. Support for the “authentication code” used to instruct the seed generation client to store the generated seed, and more particularly to replace the existing seed with the generated seed can be found on page 13, lines 2-12 and page 2, lines 31-33- page 3, lines 1-9.

#### **Allowable Subject Matter**

8. Claims 1-8, and 11-42 are allowed.

#### **Reasons for Allowance**

9. Simms (US Patent 7,373,507) teaches a method for secure generation of a seed for use in performing one or more cryptographic operations, the method comprising the steps of:

a seed generation server providing a first string to a seed generation client (Fig. 6, 604, 607; column 7, lines 13-15, *the “called party” encompasses the term “server”*; column 9, lines 12-14; the called party sends the calling party a first message, which includes the first shared random number R1);

the seed generation client generating a second string responsive to receipt of the first string, encrypting the second string utilizing a key, and sending the encrypted second string to the seed generation server (Fig. 6, 609 and 610; column 7, lines 3-4, the “calling party” encompasses the term “client”; column 9, lines 21, 30-31, a second shared random number R2 is identified; column 8, lines 46-47, this and other identification steps could comprise generating; column 9, lines 32-35, the calling party sends the called party a second message encoded with the asymmetric key  $K_{\text{public}}$ ; the second message contains the second shared random number R2);

the seed generation client generating the seed as a function of at least the first string and the second string (Fig. 6, 612; column 9, lines 47-54, the shared secret key  $K_{\text{ss}}$  is obtained from an output of a combining function having a first input including the first shared random number and a second input including the second shared random number); and

the seed generation server decrypting the encrypted second string and independently generating the seed as a function of at least the first string and the second string (Fig. 6, 611 and 612; column 9, lines 40-42, the second message is decoded to obtain R2; column 9, lines 47-54, the shared secret key  $K_{\text{ss}}$  is obtained from an output of a combining function having a first input including the first shared random number and a second input including the second shared random number).

However, Simms teaches away from **storing** the generated “seed” (column 10, lines 11-20, “keys are not stored on local computers... in embodiments in which keys are generated dynamically, keys never need to be stored on a filesystem. Storing keys on the system allows someone who is capable of compromising a computer to steal the keys, and decrypt messages

past, present, or future... keys are constantly changed and never stored on a computer's hard drive").

Thus, it would not have been obvious for one of ordinary skill in the art at the time of the invention to modify the invention taught by Simms such that

the seed generation server sends an authentication code to the seed generation client, the authentication code proving knowledge of the generated seed and instructing the seed generation client to store the generated seed; and

wherein the authentication code is cryptographically derived from a secret key shared by the seed generation client and the seed generation server.

10. Any comments Applicants consider necessary must be submitted no later than the payment of the Issue Fee and to avoid processing delays, should preferably accompany the Issue Fees. Such submission should be clearly labeled "Comments on Statement of Reasons for Allowance." In event of any post-allowance papers (e.g., IDS, 312 amendment, petition, etc.), Applicants are exhorted to mail papers to the Production Control branch in Publications or faxed to post-allowance papers correspondence branch at (703) 308-5864 to expedite issuing process or call PUB's Customer Service if any questions at (703) 305-8497.
